

1. Dictionary with column names, datatypes & values

```
import pandas as pd

df = pd.read_csv('Netflix.csv')

# Dictionary: column → values
col_dict = {col: df[col].tolist() for col in df.columns}

# Datatypes of columns
print(df.dtypes)
```

Title	str
Genre	str
Languages	str
Series or Movie	str
Hidden Gem Score	float64

dtype:	object

2. Find duplicate rows & drop them

```
: # Count duplicate rows
duplicate_count = df.duplicated().sum()
print("Number of duplicate rows:", duplicate_count)

# Drop duplicates
df_dedup = df.drop_duplicates()

Number of duplicate rows: 6123
```

3. Check if film titles have unique release dates

```
: # Sort by Title and Date, then keep the first occurrence
df_dedup = df_dedup.sort_values(['Title', 'Release Date'])
df_final = df_dedup.drop_duplicates(subset='Title', keep='first')

print(f"Cleaned dataset size: {len(df_final)}")

Cleaned dataset size: 9093
```

4. Missing value percentage (per column)

```
: missing_percent = df_dedup.isnull().mean() * 100  
print(missing_percent)
```
